

# Lecture 7.1: Consequences of the spectral theorem

Optimization and Computational Linear Algebra for Data Science

# The Spectral theorem

## Theorem

Let  $A \in \mathbb{R}^{n \times n}$  be a **symmetric** matrix. Then there is a orthonormal basis of  $\mathbb{R}^n$  composed of eigenvectors of  $A$ .

That means that if  $A$  is symmetric, then there exists an orthonormal basis  $(v_1, \dots, v_n)$  of  $\mathbb{R}^n$  and  $\lambda_1, \dots, \lambda_n \in \mathbb{R}$  such that

$$Av_i = \lambda_i v_i \quad \text{for all } i \in \{1, \dots, n\}.$$

## Theorem (Matrix formulation)

Let  $A \in \mathbb{R}^{n \times n}$  be a **symmetric** matrix. Then there exists an orthogonal matrix  $P$  and a diagonal matrix  $D$  of sizes  $n \times n$  such that

$$A = PDP^T.$$

# Consequences

If

$$A = P \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & & \vdots \\ \vdots & & \ddots & 0 \\ 0 & \cdots & 0 & \lambda_n \end{pmatrix} P^T$$

for some orthogonal matrix  $P$  then:

**Consequence #1:**  $\lambda_1, \dots, \lambda_n$  are the only eigenvalues of  $A$ , and the number of time that an eigenvalue appear on the diagonal equals its multiplicity.

# Proof sketch on an example

Consider  $n = 3$  and

$$A = P \begin{pmatrix} 3 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & -1 \end{pmatrix} P^{\top} \quad \text{where} \quad P = \begin{pmatrix} | & | & | \\ v_1 & v_2 & v_3 \\ | & | & | \end{pmatrix}$$

is an orthogonal matrix.

# Consequences

If

$$A = P \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & & \vdots \\ \vdots & & \ddots & 0 \\ 0 & \cdots & 0 & \lambda_n \end{pmatrix} P^T$$

for some orthogonal matrix  $P$  then:

**Consequence #2:** The rank of  $A$  equals to the number of non-zero  $\lambda_i$ 's on the diagonal:

$$\text{rank}(A) = \#\{i \mid \lambda_i \neq 0\}.$$

# Proof

# Consequences

If

$$A = P \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & & \vdots \\ \vdots & & \ddots & 0 \\ 0 & \cdots & 0 & \lambda_n \end{pmatrix} P^T$$

for some orthogonal matrix  $P$  then:

**Consequence #3:**  $A$  is invertible if and only if  $\lambda_i \neq 0$  for all  $i$ . In such case

$$A^{-1} = P \begin{pmatrix} 1/\lambda_1 & 0 & \cdots & 0 \\ 0 & 1/\lambda_2 & & \vdots \\ \vdots & & \ddots & 0 \\ 0 & \cdots & 0 & 1/\lambda_n \end{pmatrix} P^T$$

# Proof

# Consequences

If

$$A = P \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & & \vdots \\ \vdots & & \ddots & 0 \\ 0 & \cdots & 0 & \lambda_n \end{pmatrix} P^T$$

for some orthogonal matrix  $P$  then:

**Consequence #4:**  $\text{Tr}(A) = \lambda_1 + \cdots + \lambda_n$ .
